DAYSHIFT™ Record • Play • Timeshift

DAYSHIFT is a versatile platform that supports three functions: recording, single file playback, and digital timeshifting. Record manually or with a scheduled start time; search for and play individual files; or start playback while the file is still encoding.

We use the Dell Small Form Factor computer for this versatile “Swiss Army Knife” solution. The included 3-Year ProSupport Plan includes overnight parts replacement and next day, on-site service if required, so you can expect the highest level of continued support and reliability.

It includes two low-profile cards that support SDI and HDMI for input and output signals.

The **MPEG-2** or **MP4 (H.264)** recorder can be used for manual ingest from sources ... and the File Browser allows you to locate and playback individual files. You can also use the one-time-only record scheduling capability even if you don't want to schedule an automated delayed playback.

ON SCREEN DISPLAY - With many recording applications you have no on-screen indication of what you are recording. With DAYSHIFT you can see BOTH incoming and outgoing video, so you can operate with confidence.

The **PREVIEW** window lets you select files from the File Browser for review, with transport controls and a scrub bar for positioning anywhere in the file. Just click AUTO or TAKE and the file will begin playing on the PROGRAM output.
